Motivation for Joining the LUMI Hackathon

— Roofline
 ● Momentum&Energy
 ● Derivatives
 ● Artificial Viscosity
 ● Density
 ● Gradh
 ● Gravity

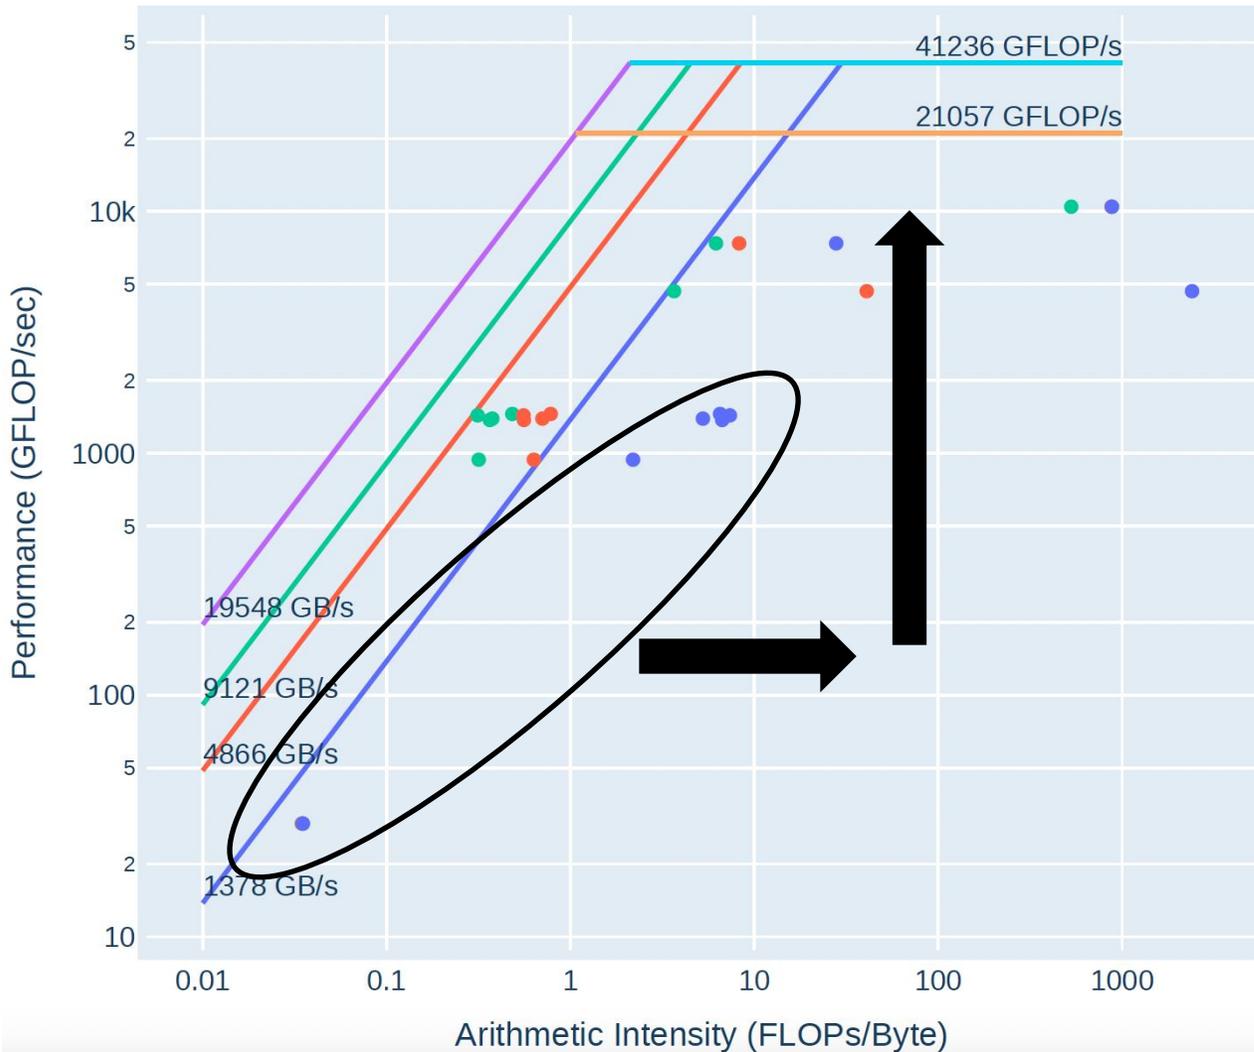

Performance of the most time consuming kernels on a single Nvidia A100 GPU.

Performance of the most time consuming kernels on a single MI250X GCD.

SPH-EXA: Plan for LUMI Hackathon

Function Name	Percentage of time per time-step
momentumEnergy	22.24%
gravity	35.63%
iadDivvCurlv	11.18%
AVSwitches	10.12%
veDefGradh	8.49%
xMass	7.47%
Total	95.14%

- Optimize per function for:
 - Increasing the arithmetic intensity
 - Increasing the performance
- Porting Nuclear-networks computations to GPU

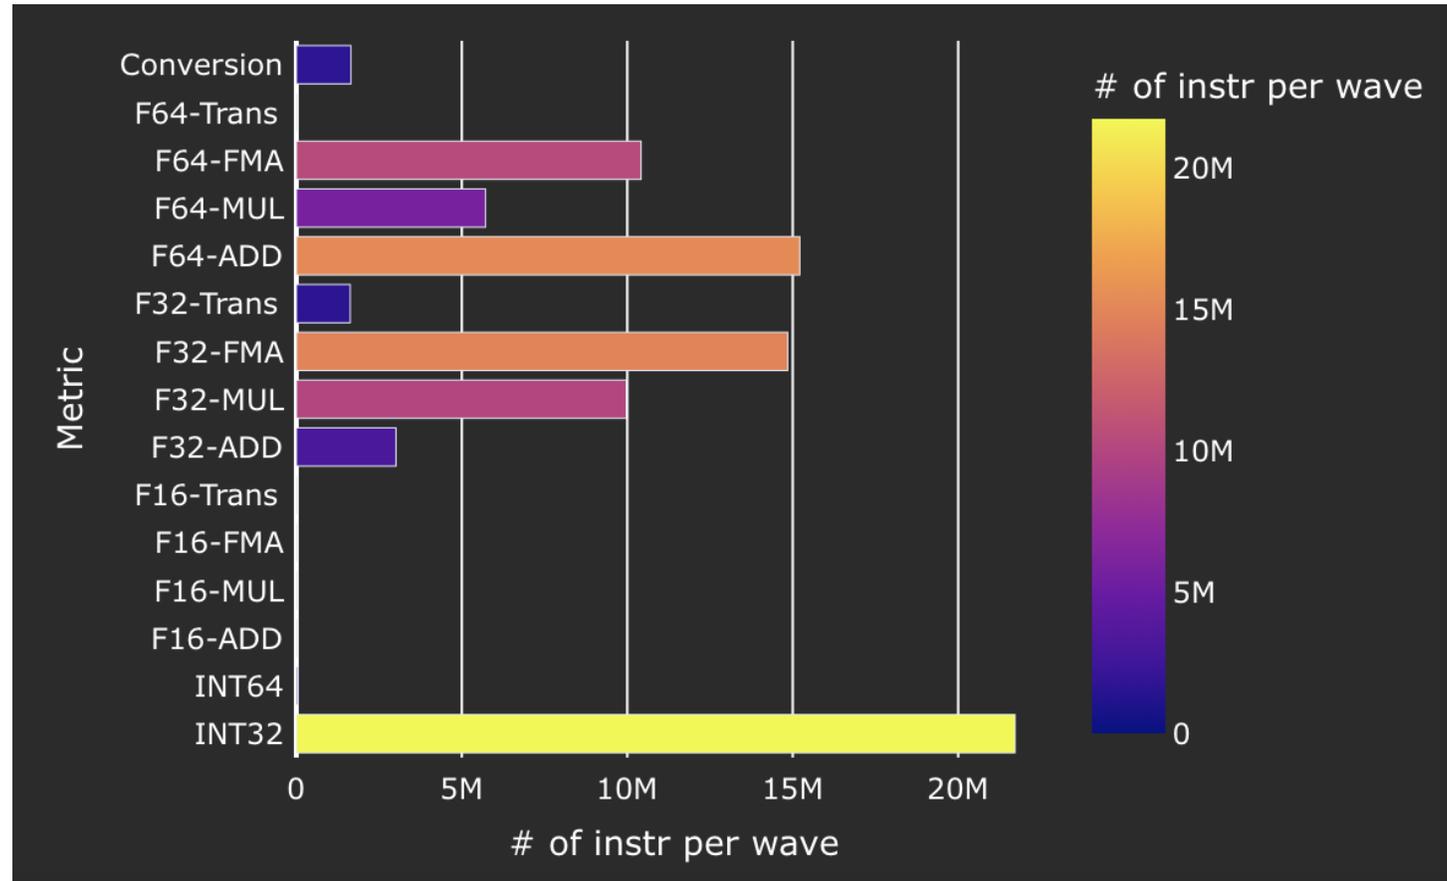

SPH-EXA: LUMI Hackathon Improvements Tried

- Use rocm/6.2.2 instead of rocm/6.0.3

Function Name	Rocm/6.0.3	Rocm/6.2.2	Performance Increase
momentumEnergy	5.45	5.47	-0.37%
gravity	8.73	6.91	20.85%
iadDivvCurlv	2.74	2.72	0.73%
AVSwitches	2.48	2.36	4.84%
veDefGradh	2.08	2.06	0.96%
xMass	1.83	1.84	-0.55%

SPH-EXA: LUMI Hackathon Improvements Tried

- Use rocm/6.2.2 instead of rocm/6.0.3 
- Reduce conversion instructions

SPH-EXA: LUMI Hackathon Improvements Tried

- Use rocm/6.2.2 instead of rocm/6.0.3 
- Reduce conversion instructions 
- Using `_launch_bounds_(256,1)` in the kernels increased the performance of momentumEnergy function

Function Name	Rocm/6.0.3	Rocm/6.2.2 (launch_bounds)	Performance Increase
momentumEnergy	5.45	3.69	32.29%
gravity	8.73	6.91	20.85%
iadDivvCurlv	2.74	2.73	0.36%
AVSwitches	2.48	2.37	4.44%
veDefGradh	2.08	2.06	0.96%
xMass	1.83	1.84	-0.55%

SPH-EXA: LUMI Hackathon Improvements Tried

- Use rocm/6.2.2 instead of rocm/6.0.3 
- Reduce conversion instructions 
- Using `_launch_bounds_(256,1)` in the kernels increased the performance of momentumEnergy function 
- `_restrict_` did not have any effect on momentumEnergyKern when used in all const pointers 
- `__builtin_nontemporal_load` or `store` did not seem to affect at least these are not used everywhere to check. 
- `float2` tried on `xmassgpu` kernel and performance didn't improve 

SPH-EXA: LUMI Hackathon Improvements Tried

```
struct TravConfig
{
    /// @brief size of global workspace memory per warp, must be a power of 2
    static constexpr unsigned memPerWarp = 256 * GpuConfig::warpSize;
    static_assert((memPerWarp & (memPerWarp - 1)) == 0);

    /// @brief number of threads per block for the traversal kernel
    static constexpr unsigned numThreads = 128;

    static constexpr unsigned numWarpsPerSm = 40;
    /// @brief maximum number of simultaneously active blocks
    inline static unsigned maxNumActiveBlocks =
        GpuConfig::smCount * (TravConfig::numWarpsPerSm / (TravConfig::numThreads / GpuConfig::warpSize));

    /// @brief number of particles per target, i.e. per warp
    static constexpr unsigned targetSize = GpuConfig::warpSize;

    /// @brief number of warps per target, used all over the place, hence the short name
    static constexpr unsigned nwt = targetSize / GpuConfig::warpSize;

    /// @brief number of blocks to launch, no longer adapts to grids that are too small to saturate all SMs
    static unsigned numBlocks() { return TravConfig::maxNumActiveBlocks; }

    /// @brief compute storage needed for traversal stack
    static unsigned poolSize()
    {
        unsigned numWarpsPerBlock = TravConfig::numThreads / GpuConfig::warpSize;
        return TravConfig::memPerWarp * numWarpsPerBlock * maxNumActiveBlocks;
    }
};
```

220

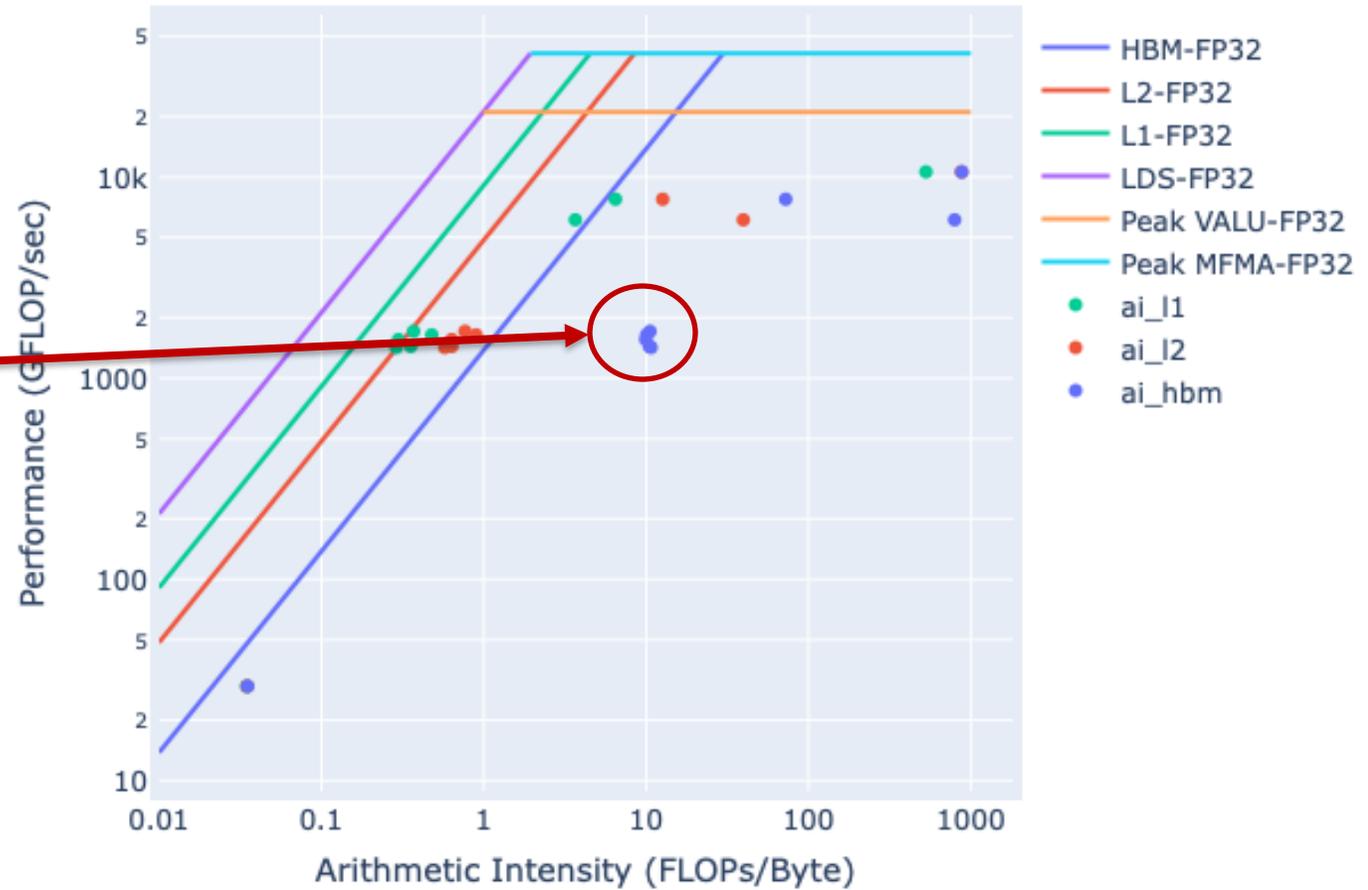

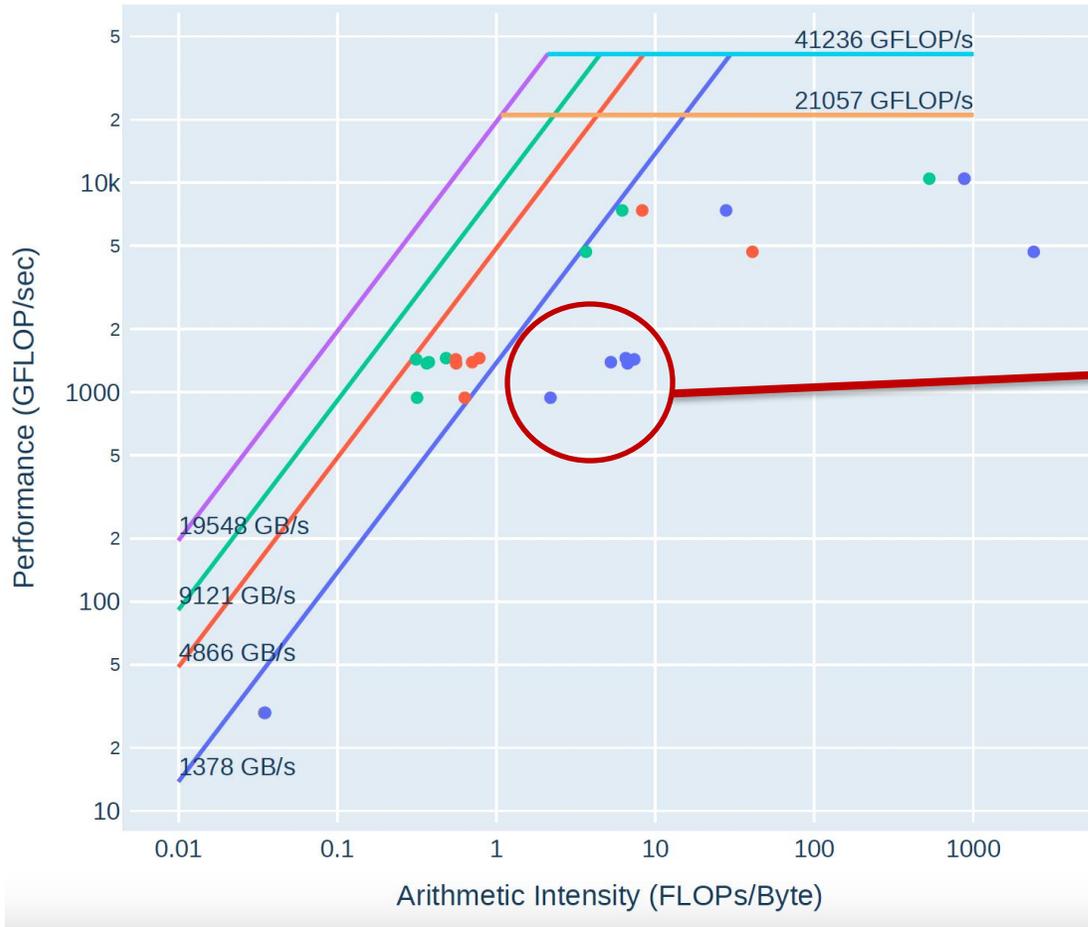

SPH-EXA: LUMI Hackathon Improvements Tried

- Updated thread and block values

Function Name	Rocm/6.0.3	Rocm/6.2.2 (launch_bounds)	Performance Increase
momentumEnergy	5.45	3.09	43.30%
gravity	8.73	6.78	22.34%
iadDivvCurlv	2.74	2.51	8.39%
AVSwitches	2.48	1.89	23.79%
veDefGradh	2.08	1.91	8.17%
xMass	1.83	1.6	12.57%

SPH-EXA: LUMI Hackathon Improvements Tried

- Updated thread and block values 

Where are we now?

- AMD MI250X vs Nvidia A100

Function Name	MI250X 1 GCD	A100	MI250X 2 GCDs
momentumEnergy	3.09	1.51	1.54
gravity	6.78	6.82	6.92
iadDivvCurlv	2.51	1.17	1.28
AVSwitches	1.89	1.06	0.95
veDefGradh	1.91	0.95	0.95
xMass	1.6	0.83	0.8
