AMD together we advance_

What is ROC-Profiler?

• ROC-profiler (also referred to as **rocprof**) is the command line front-end for AMD's GPU profiling libraries

- Repo: <u>https://github.com/ROCm-Developer-Tools/rocprofiler</u>
- rocprof contains the central components allowing application traces and counter collection
 - Under constant development
- Distributed with ROCm
- The output of rocprof can be visualized in the Chrome browser with Perfetto (<u>https://ui.perfetto.dev/</u>)

Background – AMD Profilers

Background – AMD Profilers

Objective	Where should I focus my time ?	How well am I using the GPU ?	Why am I seeing this performance ?
Approach	Timelines/Traces/Profiles/Causal-Profiles	Roofline	Hardware counters
AMD Tools		rocprof	* * *

Background – AMD Profilers

rocprof: Getting Started + Useful Flags

• To get help:

[Public]

- \${ROCM_PATH}/bin/rocprof -h
- Useful housekeeping flags:
 - --timestamp <on|off> turn on/off gpu kernel timestamps
 - --basenames <on|off> turn on/off truncating gpu kernel names (i.e., removing template parameters and argument types)
 - -o <output csv file> Direct counter information to a particular file name
 - -d <data directory> Send profiling data to a particular directory
 - -t <temporary directory> Change the directory where data files typically created in /tmp are placed. This allows you to save these temporary files.
- Flags directing rocprofiler activity:
 - -i input<.txt|.xml> specify an input file (note the output files will now be named input.*)
 - --hsa-trace to trace GPU Kernels, host HSA events (more later) and HIP memory copies.
 - --hip-trace to trace HIP API calls
 - --roctx-trace to trace roctx markers
 - --kfd-trace to trace GPU driver calls
- Advanced usage
 - -m <metric file> Allows the user to define and collect custom metrics. See <u>rocprofiler/test/tool/*.xml</u> on GitHub for examples.

rocprof: Kernel Information

- rocprof can collect kernel(s) execution stats
 - \$ /opt/rocm/bin/rocprof --stats --basenames on <app with arguments>
- This will output two csv files:
 - results.csv: information per each call of the kernel
 - results.stats.csv: statistics grouped by each kernel
- Content of results.stats.csv to see the list of GPU kernels with their durations and percentage of total GPU time:

"Name","Calls","TotalDurationNs","AverageNs","Percentage"
"JacobiIterationKernel",1000,556699359,556699,43.291753895270446
"NormKernel1",1001,430797387,430367,33.500980655394606
"LocalLaplacianKernel",1000,280014065,280014,21.775307970480817
"HaloLaplacianKernel",1000,14635177,14635,1.1381052818810995
"NormKernel2",1001,3770718,3766,0.2932300765671734
"__amd_rocclr_fillBufferAligned.kd",1,8000,8000,0.0006221204058583505

• In a spreadsheet viewer, it is easier to read:

	A	В	С	D	E
1	Name	Calls	TotalDurationNs	AverageNs	Percentage
2	JacobiIterationKernel	1000	556699359	556699	43.2917538952704
3	NormKernel1	1001	430797387	430367	33.5009806553946
4	LocalLaplacianKernel	1000	280014065	280014	21.7753079704808
5	HaloLaplacianKernel	1000	14635177	14635	1.1381052818811
6	NormKernel2	1001	3770718	3766	0.293230076567173
7	amd rocclr fillBufferAligned	1	8000	8000	0.000622120405858

rocprof: Collecting Application Traces

 rocprof can collect a variety of trace event types, and generate timelines in JSON format for use with Perfetto, currently:

Trace Event	rocprof Trace Mode
HIP API call	hip-trace
GPU Kernels	hip-trace
Host <-> Device Memory copies	hip-trace
CPU HSA Calls	hsa-trace
User code markers	roctx-trace

- You can combine modes like --hip-trace --hsa-trace
- If profiling OpenMP offload code, --hsa-trace is required to show HSA activity

rocprof + Perfetto: Collecting and Visualizing Application Traces

- rocprof can collect traces
 - \$ /opt/rocm/bin/rocprof --hip-trace <app with arguments>

This will output a .json file that can be visualized using the chrome browser and Perfetto (https://ui.perfetto.dev/)

rocprof: Collecting Application Traces with rocTX Markers and Regions

177587.3 s +

- rocprof can collect user defined regions or markers using rocTX
- Annotate code with roctx regions: #include <roctx.h>

```
...
roctxRangePush("reduce_for_c");
reduce_function ();
roctxRangePop();
```

Annotate code with roctx markers:

```
...
roctxMark("start of some code");
// some_code
roctxMark("end of some code");
```

 Add roctx and roctracer libraries to link line: -L\${ROCM_PATH}/lib -lroctx64 -lroctracer64 X = CPU HIP API 2 hipMem... hipMemcpy hipMemcpy Thread 83601 ∧ GPU814 Thread 0 Thread 1 Markers and Ranges 0 Jacobi_t::Jacobi_t::Top Level Init Thread 83601 InitializeData::Init COPY 1 CopyHostToDe... Thread 0 СоруНо... CopyHostTo... ✓ GPU06 **Roctx Marker** Roctx Range

0.78 s

0.80 s

- Profile with --roctx-range option:
 - \$ /opt/rocm/bin/rocprof --hip-trace --roctx-trace <app with arguments>

• • •

rocprof: Collecting Hardware Counters

- rocprof can collect a number of hardware counters and derived counters
 - \$ /opt/rocm/bin/rocprof --list-basic
 - \$ /opt/rocm/bin/rocprof --list-derived
- Specify counters in a counter file. For example:
 - \$ /opt/rocm/bin/rocprof -i rocprof_counters.txt <app with args>
 - \$ cat rocprof_counters.txt
 - pmc : Wavefronts VALUInsts VFetchInsts VWriteInsts VALUUtilization VALUBusy WriteSize
 - pmc : SALUInsts SFetchInsts LDSInsts FlatLDSInsts GDSInsts SALUBusy FetchSize
 - pmc : L2CacheHit MemUnitBusy MemUnitStalled WriteUnitStalled ALUStalledByLDS LDSBankConflict
 - A limited number of counters can be collected during a specific pass of code
 - Each line in the counter file will be collected in one pass
 - You will receive an error suggesting alternative counter ordering if you have too many / conflicting counters on one line
 - A csv file will be created containing all the requested counters for each invocation of every kernel

[Public]

rocprof: Commonly Used GPU Counters

VALUUtilization	The percentage of ALUs active in a wave. Low VALUUtilization is likely due to high divergence or a poorly sized grid
VALUBusy	The percentage of GPUTime vector ALU instructions are processed. Can be thought of as something like compute utilization
FetchSize	The total kilobytes fetched from global memory
WriteSize	The total kilobytes written to global memory
L2CacheHit	The percentage of fetch, write, atomic, and other instructions that hit the data in L2 cache
MemUnitBusy	The percentage of GPUTime the memory unit is active. The result includes the stall time
MemUnitBusy MemUnitStalled	The percentage of GPUTime the memory unit is active. The result includes the stall time The percentage of GPUTime the memory unit is stalled

Full list at: https://github.com/ROCm-Developer-Tools/rocprofiler/blob/amd-master/test/tool/metrics.xml

Performance Counters Tips and Tricks

- GPU Hardware counters are global
 - Kernel dispatches are serialized to ensure that only one dispatch is ever in flight
 - It is recommended that no other applications are using the GPU when collecting performance counters
- Use --basenames on which will report only kernel names, leaving off kernel arguments
- How do you time a kernel's duration?
 - \$ /opt/rocm/bin/rocprof --timestamp on -i rocprof_counters.txt <app with args>
 - This produces four times: DispatchNs, BeginNs, EndNs, and CompleteNs
 - Closest thing to a kernel duration: EndNs BeginNs
 - If you run with "--stats" the resultant results.stats.csv file will include a kernel duration column
 - Note: the duration is aggregated over repeated calls to the same kernel

[Public]

rocprof: Multiple MPI Ranks

- rocprof can collect counters and traces for multiple MPI ranks
- Say you want to profile an application usually called like this: mpiexec -np <n> ./Jacobi_hip -g <x> <y>
- Invoke the profiler by executing:

```
mpiexec -np <n> rocprof <rocprof_options> ./Jacobi_hip -g <x> <y>
or
srun --ntasks=n rocprof <rocprof options> ./Jacobi hip -g <x> <y>
```

- By directing output files from each rank to different directories, we can collect traces for each rank separately
 - Use a helper script for this, and run your program as shown below:
 mpiexec -np <n> helper_rocprof.sh ./Jacobi_hip -g <x> <y>
- Multi-node profiling currently isn't supported

Profiling Multiple MPI Ranks

\$cat rocprof_wrapper.sh

```
#!/bin/bash
set -euo pipefail
# depends on ROCM PATH being set outside; input arguments are the output directory & the name
outdir="$1"
name="$2"
if [[ -n ${OMPI COMM WORLD RANK+z} ]]; then
    # mpich
    export MPI RANK=${OMPI COMM WORLD RANK}
elif [[ -n ${MV2 COMM WORLD RANK+z} ]]; then
    # ompi
    export MPI RANK=${MV2 COMM WORLD RANK}
elif [[ -n ${SLURM PROCID+z} ]]; then
    export MPI RANK=${SLURM PROCID}
else
    echo "Unknown MPI layer detected! Must use OpenMPI, MVAPICH, or SLURM"
    exit 1
fi
rocprof="${ROCM PATH}/bin/rocprof"
                                                              Output directory per rank
pid="$$"
                                                          Filenames annotated with rank as well
outdir="${outdir}/rank_${pid}_${MPI_RANK}"
outfile="${name}_${pid}_${MPI_RANK}.csv"
${rocprof} -d ${outdir} --hsa-trace -o ${outdir}/${outfile} ("${@:3})*
                                                                          Application and its arguments
```

- As with every profiling tool, there is an overhead
- The percentage of the overhead depends on the profiling options used
 For example, tracing is faster than hardware counter collection
- When collecting many counters, the collection may require multiple passes
- With rocTX markers/regions, tracing can take longer and the output may be large
 - Sometimes too large to visualize
- The more data collected, the more the overhead of profiling
 - Depends on the application and options used

[Public]

Summary

- rocprof is the open source, command line AMD GPU profiling tool distributed with ROCm
- Many other tools are built over rocprof
- rocprof provides tracing of GPU kernels, HIP API, HSA API and Copy activity
- rocprof can be used to collect GPU hardware counters with additional overhead
- JSON Traces can be viewed in Perfetto UI
- Other output files are in text/CSV format
